Customized Joint Implants Popular Among Orthopedic Surgeons: Clinical Efficacy Important Internationally

iData Research released a new survey, sampling a total of 14,760 health professionals attended the American Academy of Orthopaedic Surgeons Conference in 2014.

Vancouver, BC ([PRWEB](#)) February 11, 2015 -- According to a new extensive survey of hundreds of physicians that was conducted by iData Research (www.idataresearch.com), nearly half of surveyed orthopedic surgeons who attended the AAOS (American Academy of Orthopaedic Surgeons) Conference see a benefit to using custom joint implants.

Many surgeons gave unique feedback as to why, or why not, they choose to employ custom implants. The option to provide **better implant fit and individualization for anatomical differences ranked highly**. However, ease-of-use for custom implants was not a prevalent reason.

According to a 2014 survey of nearly 15,000 AAOS (American Academy of Orthopaedic Surgeons) orthopaedic health professionals, only **17%** of them see benefit to using patient

Kinematic Alignment Total Knee Replacement with Personalized Instruments

[William G. Blakeney](#)^{1 2}, [Pascal-André Vendittoli](#)^{1 3} [Charles Rivière](#)¹, [Pascal-André Vendittoli](#)²

Excerpt

There is a very wide variation in patients' knee anatomy. The precise restoration of this anatomy during total knee arthroplasty (TKA) may improve knee balance, clinical function and patient satisfaction. In the early ages of TKA, implant sizes and surgical precision were limited. The amount of deviation from a patient's anatomy that may impact on clinical results is not clear. However, in the era of personalized joint replacement, we believe that a precision of within 2 mm or 2° should be the goal. Performing a kinematically aligned (KA) TKA requires accurate planning of resections and precise tools to achieve the set goals. Patient-specific instrumentation is a very attractive solution. These patient-specific instruments (PSI) are constructed based upon preoperative planning using either tomographic or magnetic resonance imaging. 3D models of the patient's knee, hip and ankle are reconstructed and anatomical landmarks are identified to set the parameters of tibia and femur resections according to the surgeon's preferences. Compared to standard instruments, computer navigation or robotic surgery, PSI results in a shorter operating time and decreased instrumentation. PSI is a simple, standardised solution for a patient-specific restricted KA protocol in TKA, with many benefits to the surgeon and patient.

Knee Surg Sports Traumatol Arthrosc 2017 Jun;25(6):1743-1748.

PSI kinematic versus non-PSI mechanical alignment in total knee arthroplasty: a prospective, randomized study

[Tilman Calliess](#)¹, [Kamil Bauer](#)¹, [Christina Stukenborg-Colsman](#)¹, [Henning Windhagen](#)¹, [Stefan Budde](#)¹, [Max Ettinger](#)²

Conclusion: Kinematic alignment is a favourable technique for TKA.

J Bone Joint Surg Am . 2017 Mar 15;99(6):521-530.

Efficacy of Patient-Specific Instruments in Total Knee Arthroplasty: A Systematic Review and Meta-Analysis

[Emmanuel Thienpont](#)¹, [Pierre-Emmanuel Schwab](#), [Peter Fennema](#)

Conclusions: PSI improves the accuracy of femoral component alignment and global mechanical alignment, but at the cost of an increased risk of outliers for the tibial component alignment. The impact of the increased probability of tibial component malalignment on implant longevity remains to be determined. Meta-analyses indicated significant differences with regard to operative time and blood loss in favor of PSI. However, these differences were minimal and, by themselves, not a substantial justification for routine use of the technology.

Knee Surg Sports Traumatol Arthrosc 2020 May;28(5):1560-1567.

Design improvement in patient-specific instrumentation for total knee arthroplasty improved the accuracy of the tibial prosthetic alignment in the coronal and axial planes

[Kazumasa Yamamura](#)¹, [Yukihide Minoda](#)², [Ryo Sugama](#)¹, [Yoichi Ohta](#)¹, [Suguru Nakamura](#)¹, [Hideki Ueyama](#)¹, [Hiroaki Nakamura](#)¹

Conclusions: This is the first report to evaluate the effect of improvement in PSI design on the postoperative alignment using 3D method, and it clearly showed that the modification significantly improved the accuracy of alignment and reduced the deviations.

Knee 2016 Mar;23(2):186-90.

Favourable rotational alignment outcomes in PSI knee arthroplasty: A Level 1 systematic review and meta-analysis

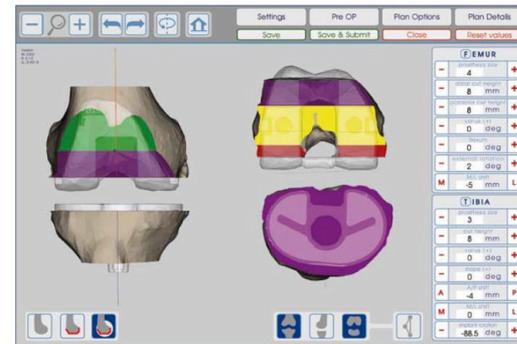

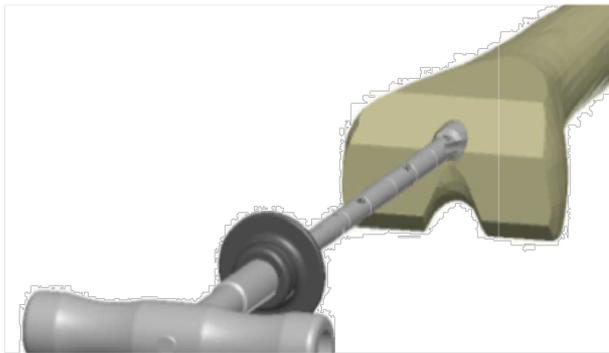

[A Mannan](#)¹, [T O Smith](#)²

Affiliations expand

Conclusions: This Level 1 meta-analysis demonstrates **favourable femoral rotational alignment** outcomes in PSI knee arthroplasty. Only limited data is available for tibial rotational outcomes. Further studies with standardised "gold-standard" measurement criteria are required to clarify tibial rotational outcomes in PSI TKA.

PERCHÈ ADOTTARE IL SISTEMA

1. Migliore posizionamento delle componenti
2. Ridurre aggressività chirurgica

3. Velocità di esecuzione chirurgica

PERCHÈ ADOTTARE IL SISTEMA

4. Riduzione delle resezioni ossee
5. Riduzione del tempo-costo-assemblaggio-sterilizzazione rispetto strumentario classico
6. Planning pre operatorio affidabile e preciso
7. Tecnica riproducibile

COME FUNZIONA

1 Acquisizione CT o RMN

2 Replica in 3D del ginocchio da protesizzare

3 Pinificazione 3D e fabbricazione di guide di taglio in nylon

4 Finalizzazione della riparazione della chirurgia

RICOSTRUZIONE DEL MODELLO OSSEO 3D

Si sfruttano gli osteofiti come punti »guida « e di appoggio delle guide di taglio

Validazione del planning

The software interface includes a top toolbar with navigation icons (minus, magnifying glass, plus, left arrow, right arrow, refresh, home) and buttons for 'Settings', 'Plan Options', 'Pre OP', and 'Plan Details'. Below these are 'Save', 'Save & Submit', and 'Reset Values' buttons.

The main workspace displays six 3D views of the femur and tibia. The femur views include anterior, posterior, and distal perspectives. The tibia views include anterior, posterior, and distal perspectives. A red vertical line is visible in the femur views, and a blue vertical line is visible in the tibia views.

On the right side, there are two parameter tables for 'FEMUR' and 'TIBIA'.

Single-use, patient-specific instrumentation technology in knee arthroplasty: a comparative study between standard instrumentation and PSI efficiency system

S Giannotti¹, F Sacchetti², C Citarelli³, V Bottai³, N Bianchi³, G Agostini³, R Capanna³

Our results confirm only the improvement on reducing blood loss. In our opinion, this technique should be used in selected patients when the surgeon could have some difficulties to perform femoral cuts on coronal plane or when patients need to have a very little blood loss due to other conditions.
